1 Overview

This document introduces the NRC7394 AT-command. The NRC7394 AT-command allows users to apply fine controls over the NRC7394 modules such as: checking the modem status, scanning, connecting to an AP, opening sockets, and exchanging data.

2 Basic Setup

2.1 Hardware

The AT-command communication is achieved via the UART or SPI interface between the NRC7394 and an external host.

Figure 2.1 shows the NRC7394 Evaluation Board (EVB). Figure 2.1 shows the NRC7394 Evaluation Kit (EVK) using a Raspberry Pi 4 model B as host.

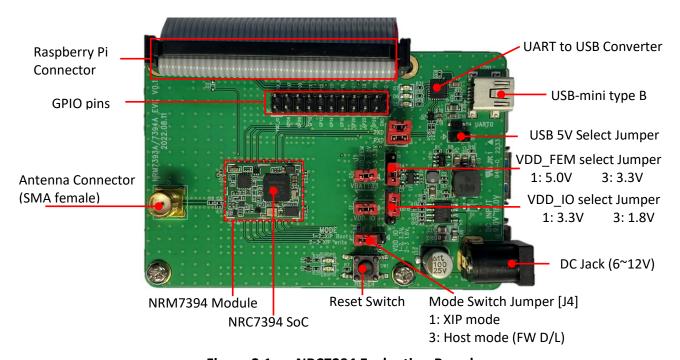

Figure 2.1 NRC7394 Evaluation Board

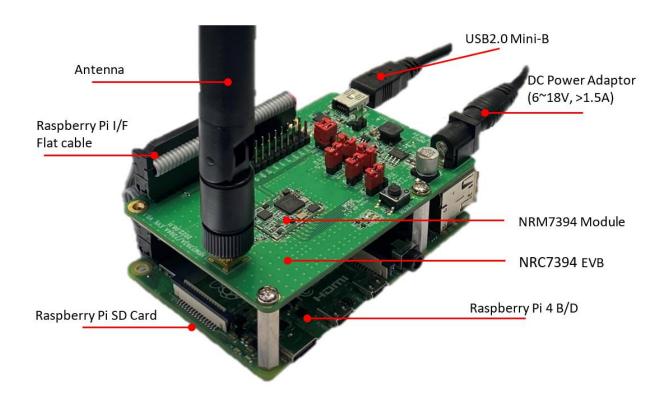

Figure 2.2 NRC7394 Evaluation Kit with Raspberry Pi 4 model B

Figure 2.3 shows the pin maps of the 20-pin and 40-pin headers on the NRC7394 EVB.

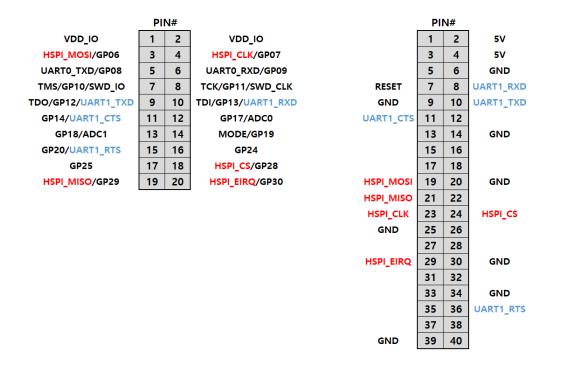

Figure 2.3 Pin maps of the 20-pin and 40-pin headers on the NRC7394 EVB

PIN# 3.3V 2 **5V** GPIO 2 (SDA) 4 5V GPIO 3 (SCL) 5 6 **GND** GPIO 4 (GPCLKO) 7 8 GPIO 14 (TXD) 9 **GND** 10 GPIO 15 (RXD) **GPIO 17 (RTS)** 11 12 GPIO 18 (PCM_CLK) **GPIO 27** 13 14 GND GPIO 22 GPIO 23 15 16 GPIO 24 3.3V 17 18 19 GPIO 10 (MOSI) 20 **GND** GPIO 9 (MISO) **GPIO 25** 21 22 GPIO 11 (SCLK) 23 24 GPIO 8 (CEO) **GND** 25 26 **GPIO 7 (CE1)** GPIO 0 (ID_SD) 27 28 GPIO 1 (ID_SC) GPIO 5 GND 29 30 GPIO 6 31 32 **GPIO 12 (PWM0) GPIO 13 (PWM1)** 33 34 GND GPIO 19 (PCM_FS) 35 36 GPIO 16 (CTS) **GPIO 26** GPIO 20 (PCM DIN) 37 38

GND

Figure 2.4 Pin map of the 40-pin header on the Raspberry Pi board

40

GPIO 21 (PCM_DOUT)

39

NOTE:

If the host is connected with a 20-pin header, detach the Raspberry Pi board from the EVB first before proceeding. The EVB must be used as a standalone for stable AT communication.

2.1.1 **UART**

The NRC7394 AT command firmware uses UART channel 1. RTS/CTS is optional and is required to use baudrate greater than 115,200 bps.

To perform AT command communication through UART on Raspberry Pi, Serial Port must be enabled in the Raspberry Pi configuration tool.

sudo raspi-config

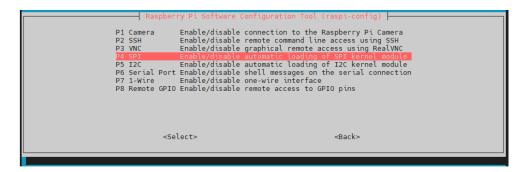

2.1.2 **HSPI**

The NRC7394 has a dedicated SPI slave controller for high speed. HSPI_EIRQ is optional.

To perform AT command communication through SPI on Raspberry Pi, spidev (User mode SPI device driver) must be enabled.

First, SPI interface must be enabled in the Raspberry Pi configuration tool.

sudo raspi-config

If spidev0.0 and spidev0.1 are not created under /dev directory, open and check the /boot/config.txt.

```
Uncomment some or all of these to enable the optional hardware interfaces
#dtparam=i2c_arm=on
#dtparam=i2s=on
dtparam=spi=on
# Uncomment this to enable infrared communication.
#dtoverlay=gpio-ir,gpio_pin=17
#dtoverlay=gpio-ir-tx,gpio_pin=18
# Additional overlays and parameters are documented /boot/overlays/README
# Enable audio (loads snd bcm2835)
dtparam=audio=on
[pi4]
# Enable DRM VC4 V3D driver on top of the dispmanx display stack
dtoverlay=vc4-fkms-v3d
max_framebuffers=2
[all]
#dtoverlay=vc4-fkms-v3d
enable uart=1
dtoverlay=disable-bt
dtoverlay=disable-wifi
#dtoverlay=newracom
```

After rebooting the Raspberry Pi, spidev0.0 and spidev0.1 could be accessible from the userspace.

tty0
```

2.2 Software

Users need to download the firmware binary onto the flash on the NRC7394 module to enable AT-command communication via UART or SPI.

Refer to the user guide **UG-7394-004-Standalone SDK.pdf** for instructions on how to download the firmware binary. (3 How to download compiled binaries)

3 AT Command Type

There are four types of AT-commands: HELP, GET, SET and RUN.

Туре	Format	Description
HELP	AT+ <cmd>=?</cmd>	List the input argument format and description.
	AT+ <cmd></cmd>	Run with no argument.
SET or RUN	OR	OR
	AT+ <cmd>=<x1,x2,></x1,x2,></cmd>	Set or run with the given arguments.
	AT+ <cmd>?</cmd>	Query the current values with no argument.
GET	OR	OR
	AT+ <cmd>?=<x1,x2,></x1,x2,></cmd>	Query the current values with the given arguments.

Table 3.1 AT-command type

- String input parameter values must be enclosed between double quotation marks (").
- Parameters enclosed between a pair of square brackets '[]' indicate optional parameters.
- Optional parameters may be nested.
- All AT commands must be in upper-case letters and terminated by CR-LF.
- Default optional values in the parameter descriptions are indicated by the asterisk '*' characters.

4 Return for Commands

Return Message	Description
ОК	The operation for command completes successfully.
ERROR	The command is not supported.
+ <cmd>:1 ERROR</cmd>	The parameter for command is not valid.
+ <cmd>:2 ERROR</cmd>	The previous operation for command is in progress.
+ <cmd>:3 ERROR</cmd>	The operation for command failed with some error.
+ <cmd>:4 ERROR</cmd>	The operation for command is still in progress after the specified time.

5 Basic AT Commands

Commands	Description
AT	Check the AT serial interface status.
ATE	Enable or disable echo.
ATZ	Reset the hardware and restart the firmware.
AT+VER	Fetch the AT firmware version and software package version.
AT+UART	Configure the serial UART parameters.
AT+GPIOCONF	Configure the GPIO pin mode, direction and pull-up option.
AT+GPIOVAL	Read or write the output GPIO pin level.
AT+ADC	Fetch the ADC value at the selected ADC channel index.
AT+FWUPDATE	Set the information required for firmware update.
AT+FWBINDL	Download the firmware binary data to RAM and write it to FLASH.
+BEVENT	Asynchronously raised event messages.

5.1AT

Command	AT
Response	ОК
Description	Check the AT serial interface status.
Example	AT OK

5.2ATE

Command	ATEO or ATE1
Response	ОК
	Enable (ATE1) or disable (ATE0) echo. (default: disable)
Description	NOTE: Echo should typically be enabled for manual communication via a terminal.
	ATE1
	ОК
Example	4750
	ATEO OK
	OK .

5.3 ATZ

Command	ATZ
Response	
Description	Reset the hardware and restart the firmware.
Example	ATZ

5.4AT+VER

Command	GET AT+VER?
Response	GET +VER: <sdk>,<atcmd></atcmd></sdk>

	OK
	<sdk></sdk>
	SDK version
Parameters	
	<atcmd></atcmd>
	AT Command Set version
Description	Fetch the version information of current firmware.
	AT+VER?
Example	+VER:"1.0.0","1.23.5"
	ОК

5.5AT+UART

Command	SET AT+UART= <baud_rate>,<hfc> GET AT+UART?</hfc></baud_rate>
Response	SET OK GET +UART: <baud_rate>,<data_bits>,<stop_bits>,<parity>,<hfc> OK</hfc></parity></stop_bits></data_bits></baud_rate>
Parameters	<pre><baud rate=""> 9600, 19200, 38400, 57600, 115200*, 230400, 460800, 500000, 576000, 921600, 1000000, 1152000, 1500000, 2000000 <data bits=""> Always 8 (8-bit)* <stop bits=""> Always 1 (1-bit)* <parity> Always 0 (None)*</parity></stop></data></baud></pre>

	<hfc></hfc>
	0 : disable RTS/CTS*
	1 : enable RTS/CTS
	Configure the baud rate and HFC for the UART.
Description	NOTE: For higher baud rates, it is recommended to enable hardware flow control. When hardware flow control is disabled, the AT+SSEND command can only set synchronous send mode.
Example	AT+UART=115200,1 OK AT+UART? +UART:115200,8,1,0,1 OK

5.6AT+GPIOCONF

Command	SET AT+GPIOCONF= <number>,<direction>,<pull-up> GET AT+GPIOCONF? AT+GPIOCONF?=<number></number></pull-up></direction></number>	
Response	SET OK GET +GPIOCONF= <number>,<direction>,<pull-up> : OK</pull-up></direction></number>	
Parameters	<number> GPIO pin number Host Interface Type HSPI UART <direction></direction></number>	Available GPIO numbers 10, 11, 12, 13, 14, 20, 25 6, 7, 10, 11, 25, 28, 29, 30

	0: input	
	1 : output	
	<pull-up> (input pin only)</pull-up>	
	0 : pull-down	
	1 : pull-up	
Description	Configure the GPIO pin direction and pull-up option.	
	AT+GPIOCONF=10,1,1	
	ОК	
	AT+GPIOCONF=11,0,0	
	OK	
	AT+GPIOCONF?	
F		
Example	+GPIOCONF:10,1,1	
	+GPIOCONF:11,0,0	
	:	
	ОК	
	AT+GPIOCONF?=10	
	+GPIOCONF:10,1,1	
	ОК	

5.7AT+GPIOVAL

Command	SET AT+GPIOVAL= <number>,<level> GET AT+GPIOVAL? AT+GPIOVAL?</level></number>
Response	SET OK GET +GPIOVAL: <number>,<level> OK</level></number>

<number></number>	
GPIO pin number	
Host Interface Type	Available GPIO numbers
HSPI	10, 11, 12, 13, 14, 20, 25
UART	6, 7, 10, 11, 25, 28, 29, 30
<level></level>	
0 : low	
1 : high	
Read or write the output GPIO pin level.	
AT+GPIOVAL?	
:	
+GPIOVAL:10,1	
+GPIOVAL:11,0	
:	
ок	
AT+GPIOVAL?=10	
+GPIOVAL:10,1	
ОК	
	GPIO pin number Host Interface Type HSPI UART <level> 0: low 1: high Read or write the output GPIO pin level. AT+GPIOVAL? : +GPIOVAL:10,1 +GPIOVAL:11,0 : OK AT+GPIOVAL:210 +GPIOVAL:10,1</level>

5.8AT+ADC

Command	SET AT+ADC= <controller> GET AT+ADC? AT+ADC? AT+ADC?=<channel></channel></controller>
Response	GET +ADC: <channel>,<value> : OK</value></channel>
Parameters	<controller> 0: disable 1: enable</controller>

	<markdright </markdright <markdright </markdright o, 1 <markdright </markdright <markdright </markdright <markdright<b< th=""></markdright<b<>
Description	Fetch the ADC value at the selected ADC channel.
Example	AT+ADC? +ADC:0,396 +ADC:1,448 OK AT+ADC?=0 +ADC:0,384 OK AT+ADC=0 OK AT+ADC=0 ERROR

5.9AT+FWUPDATE

Command	RUN AT+FWUPDATE SET AT+FWUPDATE= <length>[,<crc32>] GET AT+FWUPDATE?</crc32></length>
Response	RUN OK SET

	ОК	
	<u>GET</u>	
	+FWUPDATE: <length>,<crc32></crc32></length>	
	ок	
	<length></length>	
	Total length of firmware binary data.	
	4000222	
	<pre><crc32> A 32-bit hexadecimal value, prefixed with '0x' and calculated using the CRC-32</crc32></pre>	
Parameters	algorithm to detect data corruption.	
	To determine the CRC value of the 'newFW.bin' file, you can use the 'crc.py' script located in the 'package\standalone\atcmd\host\python-http-server\python' directory. Simply run the command 'python crc.py newFW.bin' and add the '0x' prefix to the result.	
	(ex) python crc.py newFW.bin	
	97cb8611	
	Set the information required for firmware update.	
Description	The SET command sets the data length and CRC value before downloading the firmware binary data with the AT+FWBINDL command. The AT+FWUPDATE=0 command resets previous settings to 0.	
	The RUN command is required after completing the download with the AT+FWBINDL command and before resetting the system. A system reset can be performed with the ATZ command.	
	Replacing the old firmware with a new one is performed by the bootloader after a system reset.	
	AT+FWUPDATE=0	
	OK	
	AT+FWUPDATE=915320,0xDAE06D27	
	ок	
Example	AT+FWUPDATE?	
Example	+FWUPDATE: 915320,0xDAE06D27	
	ОК	
	!!! Download the firmware binary data with the AT+FWBINDL SET command !!!	
AT+FWUPDATE		

ОК
ATZ

5.10 AT+FWBINDL

Command	SET AT+FWBINDL= <offset>,<length> GET AT+FWBINDL?</length></offset>
Response	SET OK GET +FWBINDL: <total_length>,<done_length> OK</done_length></total_length>
Parameters	<pre><offset> Zero-based offset of the data to download. <length> Length of data to download. <total_length> Total length of firmware binary data. <done_length> The data length written to flash memory after downloading.</done_length></total_length></length></offset></pre>
Description	Download the firmware binary data to RAM and write it to FLASH. Firmware binary data can be downloaded with multiple SET commands. After receiving the OK message for the SET command, data can be downloaded up to 4KB at a time. If no data is downloaded for 1 second, the FWBINDL_IDLE event is raised. At this time, the download can be canceled with the "AT\r\n" command without downloading the remaining data. +BEVENT:"FWBINDL_IDLE", <offset>,<length>,<count></count></length></offset>

```
When a download is cancelled, the FWBINDL DROP event is raised. However, the
           data downloaded with the previous SET command remains, so canceled data can be
           downloaded again.
             +BEVENT:"FWBINDL_DROP", <offset>,<length>
           If data is downloaded without cancellation, the FWBINDL_DONE event is raised.
           After the FWBINDL DONE event, the next data can continue to be downloaded
           with the SET command.
             +BEVENT:"FWBINDL_DONE", <offset>,<length>
           AT+FWUPDATE=915320,0xDAE06D27
           OK
           AT+FWBINDL?
           +FWBINDL:915320,0
           OK
           AT+FWBINDL=0,4096
           OK
           < data >
           +BEVENT:"FWBINDL DONE",0,4096
           AT+FWBINDL=4096,4096
           OK
           < data >
           +BEVENT:"FWBINDL DONE",4096,4096
Example
           AT+FWBINDL=8192,4096
           OK
           < data >
           +BEVENT: "FWBINDL DONE", 8192, 4096
           AT+FWBINDL=909312,4096
           OK
           < data >
           +BEVENT:"FWBINDL DONE",909312,4096
           AT+FWBINDL=913408,1912
           OK
           < data >
           +BEVENT: "FWBINDL DONE", 913408, 1912
```

	l l	AT+FWBINDL?
١	+	+FWBINDL:915320,915320
		OK

5.11 +BEVENT

Response	+BEVENT: <event>[,<parameter 1="">,,<parameter n="">]</parameter></parameter></event>	
<pre>Parameters **Count ></pre>		
Description	ion Asynchronously raised event messages.	
Example	+BEVENT:"FWBINDL_IDLE",102400,4096,1024 +BEVENT:"FWBINDL_DROP",102400,4096 +BEVENT:"FWBINDL_DONE",909312,4096	

6 Wi-Fi AT Commands

Commands	Description
AT+WMACADDR	Read the MAC address.
AT+WCOUNTRY	Configure the Wi-Fi country code
AT+WTXPOWER	Set the transmission power level.
AT+WRXSIG	Fetch or monitor the RSSI (dBm) and SNR (dB) values.
AT+WRATECTRL	Toggle the MCS rate control option.
AT+WMCS	Set the MCS index.
AT+WDUTYCYCLE	Configure duty cycle operation.
AT+WCCATHRESHOLD	Set CCA threshold.
AT+WTXTIME	Set carrier sense time and pause time.
AT+WTSF	Read the elapsed TSF timer duration.
AT+WBI	Get the beacon interval of the connected AP in STA mode.
AT+WLI	Set the listen interval in STA mode.
AT+WSCAN	Perform Wi-Fi scanning.
AT+WSCANSSID	Perform Wi-Fi scanning with probe request frames that specify full SSID.
AT+WCONN	Connect to a new AP.
AT+WDISCONN	Disconnect from the AP or abort an on-going connection process.
AT+WSOFTAP	Run as the AP mode.
AT+WSOFTAPSSID	Set how to specify the SSID in the beacon frame.
AT+WBSSMAXIDLE	Configure the BSS Max idle service for SoftAP.
AT+WSTAINFO	Get information of associated STAs on AP mode.
AT+WMAXSTA	Set the maximum number of STAs allowed in AP mode.
AT+WIPADDR	Configure the IPv4 address.
AT+WDNS	Configure the IP address for the DNS server.
AT+WDHCP	Request dynamic IP allocation from the DHCP server.

AT+WDHCPS	Run the DHCP sever in SoftAP mode.	
AT+WPING	Send ICMP ECHO_REQUEST to network hosts with IPv4 address.	
AT+WDEEPSLEEP	Configure deep-sleep mode to save power.	
AT+WFOTA	Enable or disable Firmware Over-the-Air (FOTA).	
AT+WCTX	Send dummy data frames for continuous TX without connecting to AP.	
AT+WTIMEOUT	Configure the response timeout for the specified command.	
+WEVENT	Asynchronously raised Wi-Fi event messages.	

6.1AT+WMACADDR

Command	Command GET AT+WMACADDR?	
Response +WMACADDR:" <mac address="">" OK</mac>		
Parameters		
Description Read the MAC address.		
Example	AT+ WMACADDR? +WMACADDR:"2F:33:4F:65:11:20" OK	

6.2AT+WMACADDR0

Command	GET AT+WMACADDR0?
Response +WMACADDR0:" <mac address="">" OK</mac>	
Parameters	
Description Read the MAC address for interface 0. It is the same as AT+WMACADDR comm	
Example	AT+ WMACADDR0? +WMACADDR0:"2F:33:4F:65:11:20" OK

6.3AT+WMACADDR1

Command GET AT+WMACADDR1?	
Response	GET +WMACADDR:" <mac address="">"</mac>

	OK	
Parameters		
Description	Read the MAC address for interface 1.	
Example	AT+ WMACADDR1? +WMACADDR1:"2F:33:4F:65:11:20" OK	

6.4AT+WCOUNTRY

Command	Command SET AT+WCOUNTRY=" <country code="">" GET AT+WCOUNTRY?</country>	
Response	SET OK GET +WCOUNTRY=" <country code="">" OK</country>	
Parameters	<pre><country code=""></country></pre>	
Description	Configure the Wi-Fi country code NOTE: The country code may need to be set after booting.	
Example	AT+ WCOUNTRY ="US" OK AT+WCOUNTRY?	

+WCOUNTRY:"US"
ОК

6.5AT+WTXPOWER

Command	SET AT+WTXPOWER= <txpower> GET AT+WTXPOWER?</txpower>	
Response	SET OK GET +WTXPOWER: <txpower></txpower>	
Parameters	<tx power=""> Transmission Power Level (unit : dBm) - 0 : AUTO mode - 1 30 : FIXED mode</tx>	
Description	Set or get the transmission power level. Default mode is AUTO. In AUTO mode, TX power is set automatically according to MCS. And the value obtained by GET command is the TX power in the last transmission. NOTE: Depending on the country and channel frequency, the maximum allowed TX power may be limited to less than 30 dBm.	
Example	AT+WTXPOWER? +WTXPOWER:16 < TX power for the last transmission. OK < FIXED mode > AT+WTXPOWER=10 OK AT+WTXPOWER? +WTXPOWER:10 OK	

< AUTO mode >	
AT+WTXPOWER=	0
ОК	
AT+WTXPOWER?	
+WTXPOWER:10	< TX power for the last transmission.
ОК	

6.6AT+WRXSIG

Command	SET AT+WRXSIG = <time> GET AT+WRXSIG?</time>
Response	SET +WRXSIG: <rssi>,<snr> +WRXSIG:<rssi>,<snr> OK GET +WRXSIG:<rssi>,<snr> OK</snr></rssi></snr></rssi></snr></rssi>
Parameters	<time> Monitoring duration in seconds.</time>
Description	Fetch or monitor the RSSI (dBm) and SNR (dB) values.
Example	AT+WRXSIG? +WRXSIG:-68,31 OK AT+WRXSIG=10 +WRXSIG:-68,31 +WRXSIG:-68,30 +WRXSIG:-68,32 +WRXSIG:-68,32 +WRXSIG:-68,32 +WRXSIG:-68,32 +WRXSIG:-68,32 +WRXSIG:-68,32

+WRXSIG:-68,32	
,	
+WRXSIG:-68,32	
ОК	

6.7AT+WRATECTRL

Command	SET AT+WRATECTRL= <mode> GET AT+WRATECTRL?</mode>
Response	SET OK GET +WRATECTRL= <mode> OK</mode>
Parameters	<mode> 0: disable 1: enable*</mode>
Description	Toggle the MCS rate control option.
Example	AT+WRATECTRL:1 OK AT+WRATECTRL=0 OK AT+WRATECTRL? +WRATECTRL? +WRATECTRL:0 OK

6.8AT+WMCS

	<u>SET</u>	
C	Command	AT+WMCS= <index></index>
		<u>GET</u>

	AT+WMCS?
Response	SET OK GET +WMCS= <index> OK</index>
Parameters	<index> Modulation Coding Scheme index (0, 1, 2, 3, 4, 5, 6, 7 and 10)</index>
Description	Set or get the MCS index. NOTE: The MCS index can only be set when rate control is disabled.
Example	AT+WRATECTRL:1 OK AT+WMCS? +WMCS:7

6.9AT+WDUTYCYCLE

Command	SET AT+WDUTYCYCLE= <window>[,<duration>[,<margin>]] GET AT+WDUTYCYCLE?</margin></duration></window>
Response	SET OK GET +WDUTYCYCLE= <window>,<duration>,<margin> OK</margin></duration></window>
Parameters	<pre><window> Duty cycle window in microseconds <duration> TX duration in microseconds allowed within duty cycle window <margin> Duty reaction in microseconds</margin></duration></window></pre>
Description	Duty margin in microseconds Configure duty cycle operation.
Example	AT+WDUTYCYCLE:0,0,0 OK AT+WDUTYCYCLE=1000000,100000 AT+WDUTYCYCLE:1000000,100000,0 OK AT+WDUTYCYCLE:1000000,100000,0 OK AT+WDUTYCYCLE=0 OK AT+WDUTYCYCLE:0,0,0 OK

6.10 AT+WCCATHRESHOLD

Command	SET AT+WCCATHRESHOLD= <threshold> GET AT+WCCATHRESHOLD?</threshold>	
Response	SET OK GET +WCCATHRESHOLD= <threshold> OK</threshold>	
Parameters	<threshold> CCA threshold.(unit: dBm) (-100 ~ -35)</threshold>	
Description	Set CCA threshold.	
Example	AT+WCCATHRESHOLD? +WCCATHRESHOLD:-75 OK AT+WCCATHRESHOLD=-80 OK AT+WCCATHRESHOLD? +WCCATHRESHOLD:-80 OK	

6.11 AT+WTXTIME

Command	SET AT+WTXTIME= <cs_time>[,<pause_time>] GET AT+WTXTIME?</pause_time></cs_time>
Response	SET OK GET +WTXTIME: <cs_time>,<pause_time> OK</pause_time></cs_time>

Parameters	<cs_time> Carrier sensing time in microseconds (0 ~ 13260) <pre> cpause_time> Tx pause time in microseconds</pre></cs_time>
Description	Set carrier sense time and pause time for Listen Before Talk
Example	AT+WTXTIME? +WTXTIME:0,0 OK AT+WTXTIME=128,2000 OK AT+WTXTIME? +WTXTIME:128,2000 OK

6.12 AT+WTSF

Command	GET AT+WTSF?
Response	GET +WTSF: <time> OK</time>
Parameters	<time> Elapsed TSF timer duration in microseconds.</time>
Description	Read the elapsed TSF timer duration.
Example	AT+WTSF? +WTSF:44142384 OK

6.13 AT+WBI

Command	GET GET	
	AT+WBI?	

	<u>GET</u>
Response	+WBI: <beacon_interval></beacon_interval>
	OK
	<pre><beacon_interval></beacon_interval></pre>
Parameters	Beacon interval expressed in Time Unit (TU)
	*1TU = 1024us
	Get the beacon interval of the connected AP in STA mode.
	The beacon Interval indicates the time between beacon frames transmitted by an
	AP. Since it is expressed in TU, the beacon interval time is calculated as follows.
Description	
	Beacon Interval Time (us) = <beacon_interval> x 1024</beacon_interval>
	NOTE:
	If there is no connected AP, an ERROR message is returned.
	AT+WBI?
	ERROR
Example	AT+WCONN="halow_atcmd_open"
	OK
	AT MADIO
	AT+WBI?
	+WBI:100 OK
	UK .

6.14 AT+WLI

Command	SET AT+WLI= <listen_interval> GET AT+WLI?</listen_interval>
Response	SET OK GET +WLI: <listen_interval> OK</listen_interval>

	
Parameters	Listen interval expressed in Beacon Interval (BI)
Description	Set the listen interval in STA mode. The listen interval indicates how often the STA will wake to hear a beacon that includes a Traffic Indication Map (TIM) information element. Since it is expressed in BI, the listen interval time is calculated as follows. Listen Interval Time (us) = listen_interval> x Beacon Interval Time = listen_interval> x <beacon_interval> x 1024 If BSS MAX IDLE service is enabled in AP, the listen interval time should be less than BSS MAX IDLE time to avoid association-reject. NOTE: The listen interval can only be set before the AT+WCONN command. While connected to the AP, the SET command returns an ERROR message.</beacon_interval>
Example	AT+WLI? +WLI:0 OK AT+WLI=1000 OK AT+WLI? +WLI:1000 OK AT+WCONN="halow_atcmd_open" OK AT+WLI? +WLI:1000 OK AT+WLI? AT+WLI? AT+WLI:1000 OK

ERROR

6.15 AT+WSCAN

Command	RUN AT+WSCAN SET AT+WSCAN=[{+ -}] <freq>[@<bandwidth>][,<freq>[@<bandwidth>]] GET AT+WSCAN?</bandwidth></freq></bandwidth></freq>
Response	RUN +WSCAN: <bssid>,<freq>,<sig_level>,<flags>,<ssid> : OK SET OK GET +WSCAN:<bandwidth>,<freq>[,<freq>] : OK</freq></freq></bandwidth></ssid></flags></sig_level></freq></bssid>
Parameters	<pre><bssid> The BSSID of the AP. <freq> The center frequency of the channel. (MHz) <sig_level> The RSSI (Received Signal Strength Indicator) in dBm. <bandwidth> The bandwidth of the channel. (1/2/4 MHz) <flags> Service set flags. <ssid> The SSID of the AP.</ssid></flags></bandwidth></sig_level></freq></bssid></pre>
Description	RUN

	Perform Wi-Fi scanning.
	SET/GET
	Set the frequencies of the channel to scan or get a list of them.
	In the SET command, if the first frequency value has a '+' or '-' prefix, a new
	frequency is added or a specific frequency is excluded.
	"AT+WSCAN=0" command resets the scan frequency list to scan all supported
	channels.
	NOTE:
	The SET command cannot be used while connected to the AP and responds with ERROR.
	After "AT+WCOUNTRY" and "AT+WDISCONN" commands, the scan frequency list is
	reset to scan all supported channels.
	AT+WCOUNTRY="US"
	OK

6.16 AT+WSCANSSID

Command	<u>SET</u>
---------	------------

	AT+WSCANSSID=" <ssid>"</ssid>
Response	<pre>SET +WSCANSSID:"<bssid>",<freq>,<sig_level>,"<flags>","<ssid>" OK</ssid></flags></sig_level></freq></bssid></pre>
Parameters	<ssid> The SSID of the AP</ssid>
Description	Perform Wi-Fi scanning with probe request frame that specify full SSID.
Example	AT+WSCANSSID="halow_atcmd_open" +WSCANSSID:"8c:0f:fa:00:28:16",902.5,-74,"[ESS]","halow_atcmd_open" OK AT+WSCANSSID="halow_atcmd_sae" +WSCANSSID:"8c:0f:fa:00:28:16",906.0,-71,"[WPA3-SAE-CCMP][ESS]","halow_atcmd_sae" OK

6.17 AT+WCONN

Command	SET AT+WCONN=" <ssid bssid>"[,"<security>"[,"<password>"]] GET AT+WCONN?</password></security></ssid bssid>
Response	SET OK GET +WCONN=" <ssid>","<bssid>","<security>","<password>","<state>" OK</state></password></security></bssid></ssid>
Parameters	<pre> <ssid> The SSID of the AP. The BSSID of the AP. <security> open*, wpa2-psk (or psk), wpa3-owe (or owe), wpa3-sae (or sae) <pre> <password> (wpa2/wpa3-sae security option only) The password when wpa2/wpa3-sae security option is used. (length: 8 ~ 63)</password></pre></security></ssid></pre>

	<pre><state> State indicator: "connecting", "connected", "disconnecting" or "disconnected"</state></pre>
Description	Connect to a new AP or retrieves information about the current AP. NOTE: If an "ERROR" is returned with the error number INPROGRESS(2) or TIMEOUT(4),
	the AT-STA needs to be disconnected from the AP with the "AT+WDISCONN" command before a connection is attempted again with "AT+WCONN".
	OPEN: AT+WSCAN +WSCAN:"8c:0f:fa:00:2b:a1",922.0,-13,"[ESS]","halow ap"

6.18 AT+WDISCONN

Command	RUN AT+WDISCONN
Response	RUN OK
Description	Disconnect from the AP or abort an on-going connection process.
Example	AT+WDISCONN OK

6.19 AT+WSOFTAP

Command	SET AT+WSOFTAP= <frequency>[@<bandwidth>],"<ssid>"[,"<security>"[,"<password>"]] GET AT+WSOFTAP?</password></security></ssid></bandwidth></frequency>
Response	SET OK GET +WSOFTAP= <frequency>,"<ssid>","<security>","<password>"[,"dhcp"] OK</password></security></ssid></frequency>
Parameters	<frequency> S1G channel frequency (MHz)</frequency>

	<bandwidth></bandwidth>
	S1G channel bandwidth (1/2/4 MHz)
	<ssid></ssid>
	The SSID of the AP.
	<security></security>
	open*, wpa2-psk (or psk)
	<pre><password> (wpa2 security option only) The password when wpa2 security option is used. (length : 8 ~ 63)</password></pre>
	The password when what seedily option is used. (length 10 05)
	<pre><dhcp></dhcp></pre>
	Only included when the DHCP server is running.
	Run as the AP mode or retrieves information about the current settings.
Description	NOTE:
Description	The system should be reset to exit the AP mode.
	Software Reset is possible with the ATZ command.

6.20 AT+WSOFTAPSSID

Command	SET AT+WSOFTAPSSID= <type> GET AT+WSOFTAPSSID?</type>
Response	SET OK GET +WSOFTAPSSID: <type> OK</type>
Parameters	<type> 0: Full SSID* 1: Empty SSID (length=0) 2: Clear SSID</type>
Description	Set how to specify the SSID in the beacon frame. Empty SSID or Clear SSID is used to hide the SSID on the network. NOTE: Set the SSID type before starting the AP with the AT+WSOFTAP command.
Example	AT+WSOFTAPSSID? +WSOFTAPSSID:0 OK AT+WSOFTAPSSID=1 OK AT+WSOFTAPSSID? +WSOFTAPSSID:1 OK AT+WSOFTAP=925,"halow_atcmd_open" OK AT+WSOFTAPSSID?

6.21 AT+WBSSMAXIDLE

Command	SET AT+WBSSMAXIDLE= <period>[,<retry>] GET AT+WBSSMAXIDLE?</retry></period>
Response	SET OK GET +WBSSMAXIDLE: <period>,<retry> OK</retry></period>
Parameters	<pre><period> BSS MAX IDLE period in 1000TU (1 ~ 65535, default: 0) *TU : Time Unit (1024 us) <retry> retry count for receiving keep alive packet from STA (3 ~ 100, default: 3)</retry></period></pre>
Description	Configure the BSS MAX IDLE service for SoftAP. SoftAP disconnects STA that is inactive for BSS MAX IDLE time. If the AP does not receive a keep alive packet from the STA for BSS MAX IDLE time, it is determined that the STA is in an inactive state. The listen interval time should be less than BSS MAX IDLE time to avoid association-reject. Example: - period = 1800 TU, retry count = 5 - BSS MAX IDLE time = 1800 x (1000 x 1024) = 1843.2 secs - Total BSS MAX IDLE time = 5 x 1843.2 = 9216 secs If the period is set 0, the service is disabled.

6.30 AT+WFOTA

	<u>SET</u>
	AT+WFOTA= <check_time>[,\"<server_url>\"]</server_url></check_time>
Command	AT+WFOTA= <check_time>[,\"<server_url>\",\"<bin_name>\",<bin_crc32>]</bin_crc32></bin_name></server_url></check_time>
	<u>GET</u>

	AT+WFOTA?	
	<u>RUN</u>	
	AT+WFOTA	
Response	SET OK GET +WFOTA: <check_time>,"<server_url>","<bin_name>",<bin_crc32> OK RUN OK</bin_crc32></bin_name></server_url></check_time>	
	<pre><check_time> Interval time in seconds to get new firmware information from the server. Set to 0 to stop the getting or get manually. Set to -1 to disable FOTA operation. <server_url> HTTP or HTTPS Server URL</server_url></check_time></pre>	
Parameters	 <bin_name> Firmware binary name with extension .bin. <bin_crc32> A 32-bit hexadecimal value, prefixed with '0x' and calculated using the CRC-32 algorithm to detect data corruption. To determine the CRC value of the 'newFW.bin' file, you can use the 'crc.py' script located in the 'package\standalone\atcmd\host\python-http-server\python' directory. Simply run the command 'python crc.py newFW.bin' and add the '0x' prefix to the result. (ex) python crc.py newFW.bin 97cb8611</bin_crc32></bin_name>	
Description	FOTA(Firmware Over-the-Air) is enabled with the SET command and disabled by AT+WFOTA=-1 command. When FOTA is enabled, the current firmware starts checking for new firmware on the server. The server check interval can be controlled through the <check_time> parameter.</check_time>	

To check for new firmware, the current firmware downloads the fota.json file from the server. The server should have a fota.json file as well as firmware binary. The contents of the fota.json file are as follows.

```
1 {
2     "AT_SDK_VER" : "10.10.10",
3     "AT_CMD_VER" : "10.10.10",
4
5     "AT_HSPI_BIN" : "nrc7292_standalone_xip_ATCMD_HSPI.bin",
6     "AT_HSPI_CRC" : "750243d8",
7
8     "AT_UART_BIN" : "nrc7292_standalone_xip_ATCMD_UART.bin",
9     "AT_UART_CRC" : "793066ec",
10
11     "AT_UART_HFC_BIN" : "nrc7292_standalone_xip_ATCMD_UART_HFC.bin",
12     "AT_UART_HFC_CRC" : "8f564369"
```

After getting information about new firmware from the server, the current firmware sends a FOTA_VERSION event to the terminal or host.

```
+WEVENT:"FOTA_VERSION","<sdk_version>","<atcmd_version>"
```

After receiving the FOTA_VERSION event, the terminal or host can use the RUN command to download new firmware from the server.

If there is no fota.json file on the server, the firmware information to be downloaded can be set with the bin_name and bin_crc32 parameters. And the terminal or host can use the RUN command without receiving the FOTA_VERSION event.

The terminal or host can check the download process through FOTA_BINARY and FOTA_DOWNLOAD events from the current firmware.

```
+WEVENT: "FOTA_BINARY","<binary_name>"
+WEVENT: "FOTA_DOWNLOAD",<total_size>,<download_size>
```

When the download is complete and ready to update, the terminal or host will receive a FOTA_UPDATE event from the current firmware.

```
+WEVENT: "FOTA_UPDATE"
```

If an error occurs during the above process, the terminal or host will receive a FOTA_FAIL event from the current firmware.

+WEVENT: "FOTA_FAIL"

And FOTA will be automatically disabled.

If there are no errors, the current firmware will be replaced with the new firmware after a software reset. A software reset is possible with the ATZ command. Firmware replacement will take about 10 seconds or more.

If an error occurs while accessing the flash memory for firmware replacement, the current firmware cannot be restored. If the error still occurs after a hardware reset, the firmware can only be restored through the download tool.

NOTE:

Whether or not the firmware in the server is the latest version can be determined by comparing the version confirmed by the AT+VER command and the FOTA_VERSION event.

EVENT:

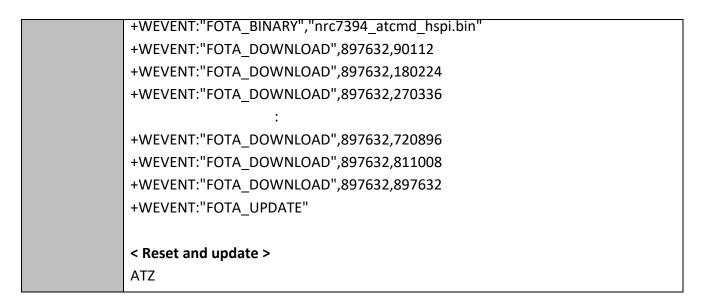

Name	Description
FOTA_VERSION	The version of new firmware on the server User SDK version
	- AT Command Set version
FOTA_BINARY	The binary name of new firmware to download from the server.
FOTA_DOWNLOAD	The binary size of new firmware being downloaded from the server. - Total size - Downloaded size
FOTA_UPDATE	The current firmware is ready to be replaced with the new firmware.
FOTA_FAIL	An error occurred during the FOTA process.

TEST:

The AT+WFOTA command can be tested using the python-http-server package in the SDK.

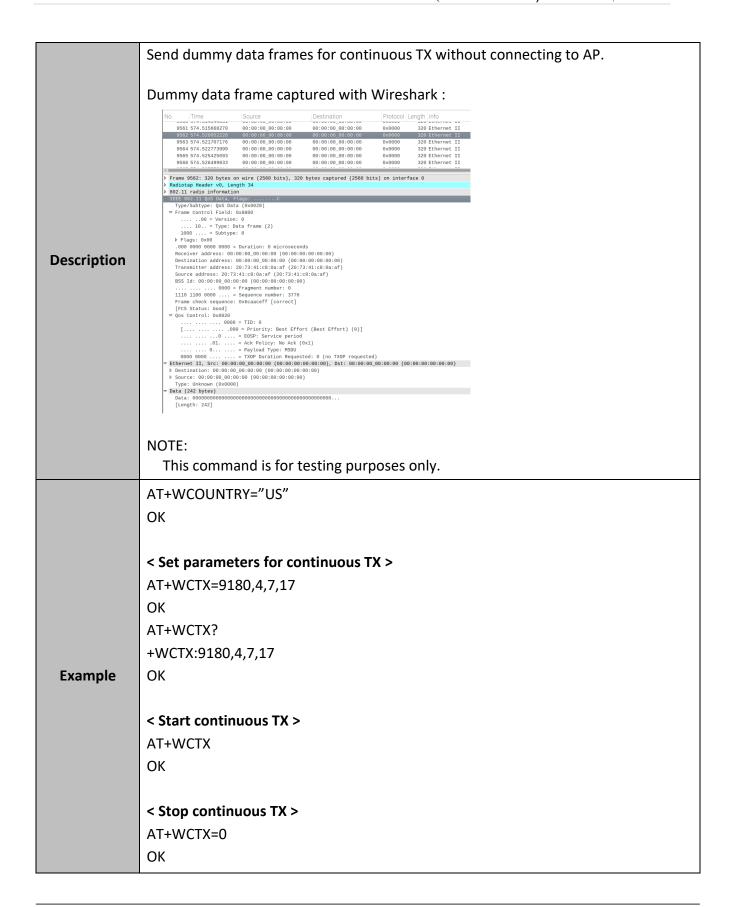

```
Path: atcmd/host/python-http-server
This package has the shell and python scripts to run HTTP/HTTPS server.
       fota.json
       nrc7292_standalone_xip_ATCMD_HSPI.bin
       nrc7292_standalone_xip_ATCMD_UART.bin
       nrc7292_standalone_xip_ATCMD_UART_HFC.bin
       Run-server.sh
          - server.crt
          server.csr
           server.key
           server.key.origin
       Update-fota-info.sh
      Shell Script
                                                   Description
      Run-sever.sh
                       Run HTTP or HTTPS server.
                       Usage:
                         $ ./Run-server.sh http
                         $ ./Run-server.sh https
     Update-fota-
                       Calculate the CRC value of firmware binaries and update the fota.json
        info.sh
                       file.
                       Usage:
                         $./Update-fota-info.sh [options]
                       Firmware version and binary name can be set by editing this file.
                           SDK_VER="10.10.10
                         7 CMD_VER="10.10.10"
                        9 HSPI_BIN="nrc7292_standalone_xip_ATCMD_HSPI.bin"
                        10 UART_BIN="nrc7292_standalone_xip_ATCMD_UART.bin"
                        11 UART_HFC_BIN="nrc7292_standalone_xip_ATCMD_UART_HFC.bin"
                       Alternatively, it can be set as options when executing the script.
                       Available options can be checked with the -h or --help option. Values
                       set as options overwrite values set in the file.
                       If a binary is replaced with a new one, the fota.json should be updated
                       by Update-fota-info.sh.
```

7 Socket AT Commands

Commands	Description
AT+SOPEN	Create a TCP/UDP socket for IPv4 domain.
AT+SCLOSE	Close an existing socket.
AT+SLIST	List all currently open sockets.
AT+SSEND	Send data through a socket.
AT+SRECV	Read buffered data from the network stack (lwip).
AT+SRECVMODE	Configures how data is read from the network stack (lwip).
AT+SRECVINFO	Configure the information level of "+RXD" message.

AT+SADDRINFO	Check the IP address from the domain name.
AT+STCPKEEPALIVE	Enable or disable TCP keepalive.
AT+STCPNODELAY	Enable or disable TCP Nagle's algorithm.
AT+STIMEOUT	Configure the response timeout for the specified socket command.
+SEVENT	Asynchronously raised socket event messages.
+RXD	An event log for a received packet with payload.

7.1AT+SOPEN

Command	SET AT+SOPEN="udp", <local_port>[,<reuse_addr>] AT+SOPEN="tcp",<local_port>[,<reuse_addr>] AT+SOPEN="tcp","<server address="">",<server port="">[,<reuse_addr>]</reuse_addr></server></server></reuse_addr></local_port></reuse_addr></local_port>
Response	SET +SOPEN= <socket id=""> OK</socket>
Parameters	<pre><local_port> (UDP) The outgoing local port. <local_port> (TCP Server)</local_port></local_port></pre>

	Local port to listen on.
	<pre><server address="">,<server port=""> (TCP Client) The IPv4 address and port number of the TCP server.</server></server></pre>
	<pre><reuse_addr> SO_REUSEADDR option (0:disable, 1:enable)</reuse_addr></pre>
	<socket id=""> The ID allocated to the socket.</socket>
Description	Create a TCP/UDP socket for IPv4 domain. A socket for TCP server will listen on the given port in the background and asynchronously raise the event CONNECT to notify incoming connections.
Example	AT+SOPEN="UDP",60000 +SOPEN=0 OK AT+SOPEN="TCP",50000 +SOPEN=1 OK +SEVENT: "CONNECT",2 AT+SOPEN="TCP","192.168.200.100",5001 +SOPEN=3 OK

7.2 AT+SCLOSE

Command	SET AT+SCLOSE= <socket id=""> RUN AT+SCLOSE</socket>
Response	SET +SCLOSE: <socket id=""> OK RUN +SCLOSE:<socket id=""></socket></socket>

	:
	+SCLOSE: <socket id=""></socket>
	ОК
Parameters	<socket id=""></socket>
Parameters	The ID allocated to the socket.
Description	Close an existing socket. To close all existing sockets, run a command without the parameter <socket id="">. If a server socket is closed, all client sockets connected to the server socket will close automatically.</socket>
	AT+SCLOSE=1
	+SCLOSE:1
	ОК
Example	AT+SCLOSE
	+SCLOSE:0
	+SCLOSE:2
	+SCLOSE:3
	ОК

7.3 AT+SLIST

Command	GET AT+SLIST?
Response	GET +SLIST: <socket id="">,"<protocol>","<remote address="">",<remote port="">,<local port=""> : +SLIST:<socket id="">,"<protocol>","<remote address="">",<remote port="">,<local port=""> OK</local></remote></remote></protocol></socket></local></remote></remote></protocol></socket>
Parameters	<pre><socket id=""> The ID allocated to the socket. <pre><pre><pre> <pre>CP or UDP </pre> </pre> <pre><remote address="">,<remote port="">,<local port=""> The remote address, remote port and local port associated with the socket.</local></remote></remote></pre></pre></pre></socket></pre>
Description	List all currently open sockets.
Example	AT+SLIST? +SLIST:0,"UDP","0.0.0.0",0,60000

+SLIST:1,"TCP","0.0.0.0",0,50000
+SLIST:2,"TCP","192.168.200.100",55354,0
+SLIST:3,"TCP","192.168.200.100",5001,52433
OK

7.4AT+SSEND

	<u>SET</u>
Command	AT+SSEND = <id>[,<length>[,<done_event>]]</done_event></length></id>
	AT+SSEND = <id>,"<remote host="">", <remote port="">[,<length>[,<done_event>]]</done_event></length></remote></remote></id>
Response	<u>SET</u>
Кезропзе	ОК
	<id></id>
	The ID allocated to the socket.
	<remote host=""> (UDP only)</remote>
	IPv4 address or domain name of the UDP server/client.
B	<remote port=""> (UDP only)</remote>
Parameters	Port number of the UDP server/client.
	·
	<length></length>
	Number of raw bytes to send.
	<done event=""></done>
	SEND_DONE event. (0:disable, 1:enable)
	Send data through a socket.
	Send data tillough a socket.
Description	Data can be sent in one of the following modes when the return message is OK.
	1. Synchronous Send
	Synchronous send mode is set when the length parameter has a positive
	number. The length parameter indicates the length of data sent with one AT+SSEND command. Data can be sent up to 4096 bytes at a time.
	AT 1952 ND command. Data can be sent up to 4050 bytes at a time.
	2. (Buffered) Passthrough Send
	Data can be continuously sent with one AT+SSEND command.

Passthrough send mode is set when the length parameter is 0 or omitted. Data is copied to the TCP/IP stack by the socket send function without buffering, and the length of the copied data is variable.

Buffered passthrough send mode is set when the length parameter has a negative number. The length parameter indicates the length of the buffer. The maximum length of the buffer is 4096 bytes. If the length parameter is -2048, data is buffered up to 2048 bytes. The maximum length of data copied to the TCP/IP stack by the socket send function is equal to the buffer length.

To exit (buffered) passthrough send mode and send a new AT command, the following is required:

- ① Wait at least 1 second after sending the last data.
- ② Send the EXIT command "AT\r\n" when SEND_IDLE event is raised.
- 3 Send a new AT command after SEND EXIT event is raised.

If an error occurs before the data is copied to the TCP/IP stack, SEND_ERROR event is raised. If the done_event parameter is set to 1, SEND_DONE event is raised when data is successfully copied to the TCP/IP stack.

NOTE:

If the host interface is UART and hardware flow control is disabled, the (buffered) passthrough send mode is not available. Data can only be sent in synchronous send mode, and it is recommended to set the done_event parameter to 1 and send the next data after checking the SEND_DONE event.

[Synchronous Send : done_event=0]

AT+SSEND=0,6

OK

Hello!

Example

[Synchronous Send : done_event=1]

AT+SSEND=0,6,1

OK

Hello!

+SEVENT:"SEND DONE",6

```
[ Passthrough Send : done_event=0 ]
AT+SSEND=0
OK
Hello, World!
Goodbye, World!
/* If no data is sent for more than 1 second, the SEND_IDLE event is raised. */
+SEVENT:"SEND IDLE",0,28,0,0
/* Send the EXIT command "AT\r\n" to exit the passthrough send mode. */
ΑT
OK
+SEVENT:"SEND_EXIT",0,28,0
[ Buffered Passthrough Send : done_event=1]
AT+SSEND=0,-8,1
OK
TEST0001
+SEVENT:"SEND_DONE",8
TEST0002
+SEVENT:"SEND DONE",8
TEST0003
+SEVENT:"SEND DONE",8
/* Wait for the SEND IDLE event without sending any data to exit the buffered
  passthrough send mode. */
+SEVENT:"SEND IDLE",0,24,0,0
ΑT
OK
+SEVENT:"SEND_EXIT",0,24,0
```

7.5 AT+SRECV

	<u>SET</u>
Command	AT+SRECV= <socket id="">[,<length>]</length></socket>
	<u>GET</u>

	AT+SRECV?
	AT+SRECV?= <socket id=""></socket>
Response	SET OK GET +SRECV: <socket_id>,<bufferd_length> OK</bufferd_length></socket_id>
Parameters	<pre><socket id=""> The ID allocated to the socket. <length> The maximum number of raw bytes to read. *If omitted or set to 0, it is set to the maximum value supported by the firmware. <bufferd_length> The number of raw bytes currently buffered</bufferd_length></length></socket></pre>
Description	Read buffered data from the network stack (lwip). NOTE: 1) AT+SRECV command can be used only when passive mode is set with AT+SRECVMODE command. 2) If it is UDP data, it will be lost when the buffer is full.
Example	AT+SLIST? +SLIST:0,"TCP","192.168.200.1",50000,0 +SLIST:1,"UDP","0.0.0.0",0,60001 OK +SEVENT:"RECV_READY",0,1024 +SEVENT:"RECV_READY",1,1024 AT+SRECV? +SRECV:0,7168 +SRECV:1,7168 OK AT+SRECV=0 +RXD:0,4096,"192.168.200.1",50000 OK

AT+SRECV=1
+RXD:1,1024,"192.168.200.1",60000
OK

+SEVENT:"RECV_READY",0,3072
+SEVENT:"RECV_READY",1,6144

AT+SRECV?=0
+SRECV:0,3072
OK
AT+SRECV?=1
+SRECV:1,6144
OK

7.6AT+SRECVMODE

Command	SET AT+SRECVMODE= <mode>[,<event>] GET AT+SRECVMODE?</event></mode>
Response	SET OK GET +SRECVMODE: <mode>,<event> OK</event></mode>
Parameters	<mode> 0: active* 1: passive <event> 0: ready event disable 1: ready event enable*</event></mode>
Description	Configures how data is read from the network stack (lwip). If the event parameter is set to 1 in passive mode, a RECV_READY event occurs when there is buffered data.

	The event does not occur again until the buffered data is read with the AT+SRECV command.
Example	AT+SRECVMODE=1 OK AT+SRECVMODE:1,0 OK AT+SRECVMODE=1,1 OK AT+SRECVMODE? +SRECVMODE? +SRECVMODE:1,1 OK AT+SRECVMODE=0 OK AT+SRECVMODE=0 OK AT+SRECVMODE? +SRECVMODE? +SRECVMODE:0,0 OK

7.7AT+SRECVINFO

Command	SET AT+SRECVINFO= <mode> GET AT+SRECVINFO?</mode>
Response	SET OK GET +SRECVINFO: <mode> OK</mode>
Parameters	<mode> 0: terse* 1: verbose</mode>
Description	Configure the information level of "+RXD" message.

	NOTE:
	The AT+SRECVINFO command is the same as the previous AT+SRXLOGLEVEL command. Only the command name is different.
	AT+SRECVINFO =1 OK
Example	AT+SRECVINFO? + SRECVINFO:1 OK

7.8AT+SADDRINFO

Command	SET AT+SADDRINFO=" <domain_name>"</domain_name>
Response	SET +SADDRINFO:" <address>" OK</address>
Parameters	<domain_name> Domain name <address> IPv4 address</address></domain_name>
Description	Check the IP address from the domain name.
Example	AT+SADDRINFO ="www.google.com" +SADDRINFO:"142.250.199.100" OK

7.9AT+STCPKEEPALIVE

Command	SET AT+STCPKEEPALIVE= <socket id="">,<keepalive>[,<keepidle>,<keepcnt>,<keepintvl>] GET AT+STCPKEEPALIVE? AT+STCPKEEPALIVE?=<socket id=""></socket></keepintvl></keepcnt></keepidle></keepalive></socket>
Response	SET OK

	<u>GET</u>			
	+STCPKEEPALIVE: <socket_id>,<keepalive>,<keepidle>,<keepcnt>,<keepintvl></keepintvl></keepcnt></keepidle></keepalive></socket_id>			
	:			
	ОК			
	<socket id=""></socket>			
	The ID allocated to the socket for TCP client.			
	<keepalive></keepalive>			
	0 : disable			
	1 : enable			
Parameters	<keepidle></keepidle>			
	The time to wait before sending out the first probe in seconds. (default : 7200)			
	<keepcnt></keepcnt>			
	The number of probes that are sent and unacknowledged. (default : 9)			
	<keepintvl></keepintvl>			
	The interval between subsequent keepalive probes in seconds. (default : 75)			
Description	Enable or disable TCP keepalive.			
	< TCP Server >			
	AT+SOPEN="TCP",50000			
	+SOPEN=0			
	OK			
	+SEVENT:"CONNECT",1			
	AT+SLIST? +SLIST:0,"TCP","0.0.0.0",0,50000			
	+SLIST:0, 1CP , 0.0.0.0 ,0,50000 +SLIST:1,"TCP","192.168.200.2",52432,0			
	OK			
	AT+STCPKEEPALIVE?			
	+STCPKEEPALIVE:1,0,7200,9,75			
Example	ОК			
	AT+STCPKEEPALIVE=1,0,60,5,30			
	OK AT CTCDVCCDALIVC			
	AT+STCPKEEPALIVE? +STCPKEEPALIVE:1,0,60,5,30			
	OK			
	AT+STCPKEEPALIVE=1,1			
	ОК			
	AT+STCPKEEPALIVE?			
	+STCPKEEPALIVE:1,1,60,5,30			

OK

<TCP Client >
AT+SOPEN="TCP","192.168.200.1",50000
+SOPEN:0

OK

7.10 AT+STCPNODELAY

Command	SET AT+STCPNODELAY= <socket id="">,{0 1} GET AT+STCPNODELAY?</socket>
Response	SET OK GET +STCPNODELAY: <socket_id>,<status> OK</status></socket_id>
Parameters	<socket id=""> The ID allocated to the socket. <status> 0: disable 1: enable</status></socket>
Description	Enable or disable TCP Nagle's algorithm.
Example	<tcp server=""> AT+SOPEN="TCP",50000</tcp>

```
+SOPEN=0
OK
+SEVENT:"CONNECT",1
AT+SLIST?
+SLIST:0,"TCP","0.0.0.0",0,50000
+SLIST:1,"TCP","192.168.200.2",52432,0
OK
AT+STCPNODELAY?
+STCPNODELAY:1,0
OK
AT+STCPNODELAY=1,1
OK
AT+STCPNODELAY?
+STCPNODELAY:1,1
OK
< TCP Client >
AT+SOPEN="TCP","192.168.200.1",50000
+SOPEN:0
OK
AT+SLIST?
+SLIST:0,"TCP","192.168.200.1",50000,0
OK
AT+STCPNODELAY?
+STCPNODELAY:0,0
OK
AT+STCPNODELAY=0,1
OK
AT+STCPNODELAY?
+STCPNODELAY:0,1
OK
```

7.11 AT+STIMEOUT

Command	SET AT+STIMEOUT=" <command/> ", <timeout> GET AT+STIMEOUT?</timeout>
Response	<u>SET</u>

	ОК		
	GET		
	+STIMEOUT:" <command/> ", <timeout></timeout>		
	ОК		
	<command/>		
Parameters	"SOPEN", "SSEND"		
Farailleters	<timeout></timeout>		
	Timeout in seconds. (0 : no timeout)		
	Configure the response timeout for the specified socket command.		
Description	Default timeout :		
	- SOPEN: 30 secs		
	- SSEND: 1 sec		
	AT+STIMEOUT?		
	+STIMEOUT:"SOPEN",30		
	+STIMEOUT:"SSEND",1		
	ОК		
	AT+STIMEOUT="SOPEN",60		
Example	ОК		
	AT+STIMEOUT="SSEND",3		
	ОК		
	AT+STIMEOUT?		
	+STIMEOUT:"SOPEN",60		
	+STIMEOUT:"SSEND",3		
	ок		

7.12 +SEVENT

Response	+SEVENT: <event>,<socket id="">[,<parameter 1="">,,<parameter n="">]</parameter></parameter></socket></event>
Parameters	<pre><event> "CONNECT",<socket id=""> "CLOSE",<socket id="">,<error>,"<description>" "SEND_DONE",<socket id="">,<done> "SEND_DROP",<socket id="">,<drop></drop></socket></done></socket></description></error></socket></socket></event></pre>

	"SEND_IDLE", <socket id="">,<done>,<drop>,<wait></wait></drop></done></socket>
	"SEND_EXIT", <socket id="">,<done>,<drop></drop></done></socket>
	"SEND_ERROR", <socket id="">,<error>,"<description>"</description></error></socket>
	"DECV_DEADY" consist ID: cloudth:
	"RECV_READY", <socket id="">,<length> "RECV_FREADY",<socket id="">,<length>" "RECV_FREADY",<socket id="">,<length>" "RECV_FREADY",<socket id="">,<length>" "RECV_FREADY",<socket id="">,</socket></length></socket></length></socket></length></socket></length></socket>
	"RECV_ERROR", <socket id="">,<error>,"<description>"</description></error></socket>
	<socket id=""></socket>
	Socket ID
	<done></done>
	The length of the sent payload.
	<drop></drop>
	The length of the dropped payload.
	The length of the dropped payload.
	<wait></wait>
	The length of the buffered payload.
	<length></length>
	The length of the receivable payload.
	COFFOR
	<pre><error> error code</error></pre>
	error code
	<description></description>
	string describing the error code
	NOTE:
	The error code may not match the POSIX error code.
	The error code defined in the errno.h file included in the ARM Toolchain is
	different from the POSIX error code.
Description	Asynchronously raised socket event messages.
	+SEVENT:"CONNECT",1
Example	+SEVENT:"CLOSE",1,128,"Socket is not connected"

+SEVENT:"SEND_DONE",1,152
+SEVENT:"SEND_DROP",1,152
+SEVENT:"SEND_IDLE",1,1500,152,200
+SEVENT:"SEND EXIT",1,1700,152
+SEVENT:"SEND_ERROR",1, 104,"Connection reset by peer"
+SEVENT:"RECV_READY",1,1488
+SEVENT:"RECV_ERROR",1, 128,"Socket is not connected"

7.13 +RXD

	RX Log Level (Terse)
	+RXD: <socket id="">,<actual length="" read=""></actual></socket>
	<raw bytes=""></raw>
Response	
	RX Log Level (Verbose)
	+RXD: <socket id="">,<actual length="" read="">,"<remote ip="">",<remote port=""></remote></remote></actual></socket>
	<raw bytes=""></raw>
	<socket id=""></socket>
	The ID allocated to the socket.
	<pre><max length="" read=""> The maximum number of butes to read (Max 2048)</max></pre>
	The maximum number of bytes to read. (Max: 2048)
	<actual length="" read=""></actual>
Parameters	Actual number of bytes read.
	<remote ip="">,<remote port=""></remote></remote>
	The remote IP and port.
	<raw bytes=""></raw>
	The received raw bytes (0x00~0xFF) payload.
	An event log for a received packet with payload.
Description	Upon receiving packets, +RXD event logs will automatically appear on the terminal
	output. Note that there will be no 'OK' message following the event log.
Example	RX Log Level (Terse)
•	+RXD=0,15

ABCDE12345,.?=+

RX Log Level (Verbose)
+RXD=0,12,"192.168.200.1",5025
HELLO,WORLD!

8 Test Application

8.1 Command Line Interface (raspi-atcmd-cli)

CLI application is a Linux program running on Raspberry Pi for AT-command communication via UART or SPI. In the CLI application, as in terminal program via UART, the user can enter the AT command and check the response to the command.

8.1.1 Source files

File	Description	
common.h	Common header file	
main.c	CLI related functions.	
Makefile	Make file for building.	
nrc-atcmd.c nrc-atcmd.h	AT command handler	
nrc-hspi.c	Protocol driver for HSPI.	
nrc-hspi.h	*Refer to this file to communicate with the ATCMD firmware via HSPI.	
nrc-iperf.c	Iperf server/client	
nrc-iperf.h	iperi server/cilent	
raspi-hif.c	Wrapper for user mode driver.	
raspi-hif.h	wrapper for user mode driver.	
raspi-eirq.c	User mode driver for GPIO EIRQ.	
raspi-spi.c	User mode driver for SPI.	
raspi-uart.c	User mode driver for UART.	
scripts/	Script files	

Table 8.1 raspi-atcmd-cli source files

8.1.2 Build

Copy the "atcmd/host/raspi-atcmd-cli" directory to the Raspberry Pi's home directory. And build the CLI application with the make command.

\$ cd \$HOME

\$ cd raspi-atcmd-cli

\$ make clean

removed 'raspi-atcmd-cli'

\$ make

cc -g -o raspi-atcmd-cli raspi-spi.c raspi-uart.c raspi-eirq.c raspi-hif.c nrc-hspi.c nrc-atcmd.c nrc-iperf.c main.c -pthread -Wall -lpthread

8.1.3 Run

Help

\$./raspi-atcmd-cli [-h|--help]

```
raspi-atcmd-cli version 1.3.3
Copyright (c) 2019-2023 < NEWRACOM LTD>
Usage:
  $ ./raspi-atcmd-cli -S [-D <device>] [-E <trigger>] [-c <clock>] [-s <script> [-n]]
  $ ./raspi-atcmd-cli -U [-D <device>] [-b <baudrate>] [-s <script> [-n]]
  $ ./raspi-atcmd-cli -U -f [-D <device>] [-b <baudrate>] [-s <script> [-n]]
UART/SPI:
  -D, --device #
                        Specify the device. (default: /dev/spidev0.0, /dev/ttyAMA0)
                        Specify the script file.
  -s, --script #
  -n, --noexit#
                        Do not exit the script when the AT command responds with an error.
SPI:
  -S --spi
                        Use the SPI to communicate with the target.
                        Use EIRQ mode for the SPI. (0:low, 1:high, 2:falling, 3:rising)
  -E, --eirq #
  -c, --clock #
                        Specify the clock frequency for the SPI. (default: 20000000 Hz)
UART:
  -U --uart
                        Use the UART to communicate with the target.
  -f --flowctrl
                        Enable RTS/CTS signals for the hardware flow control on the UART. (default: off)
  -b, --baudrate #
                        Specify the baudrate for the UART. (default: 115200 bps)
Miscellaneous:
                        Print version information and quit.
  -v, --version
  -h, --help
                        Print this message and quit.
```

SPI

The maximum clock frequency is 20MHz.

\$ sudo ./raspi-atcmd-cli -S [-D <device>] [-E <trigger>] [-c <clock>] [-s <script> [-n]]

```
$ sudo ./raspi-atcmd-cli -S -c 20000000 -E 2

[ SPI ]
    - device: /dev/spidev0.0
    - clock: 20000000 Hz
    - eirq: falling
```

UART

The maximum baud rate is 115,200bps without the hardware flow control.

\$ sudo ./raspi-atcmd-cli -U [-D <device>] [-b <baudrate>] [-s <script> [-n]]

```
$ sudo ./raspi-atcmd-cli -U -b 115200

[ UART ]
  - device: /dev/ttyAMA0
  - baudrate : 115200

#
```

UART_HFC

If the baud rate setting is more than 115,200bps, the hardware flow control needs to be enabled with -f option on the UART.

\$ sudo ./raspi-atcmd-cli -U -f [-D <device>] [-b <baudrate>] [-s <script> [-n]]

```
$ sudo ./raspi-atcmd-cli -U -f -b 2000000

[ UART_HFC ]
  - device: /dev/ttyAMA0
  - baudrate : 2000000
```

# EXIT
```

8.1.4 Run with a script

CLI application provides the option to run the script file. (-s/--script)

UART/SPI:	
-s,script #	Specify the script file.
-n,noexit #	Do not exit the script when the AT command responds with an error.

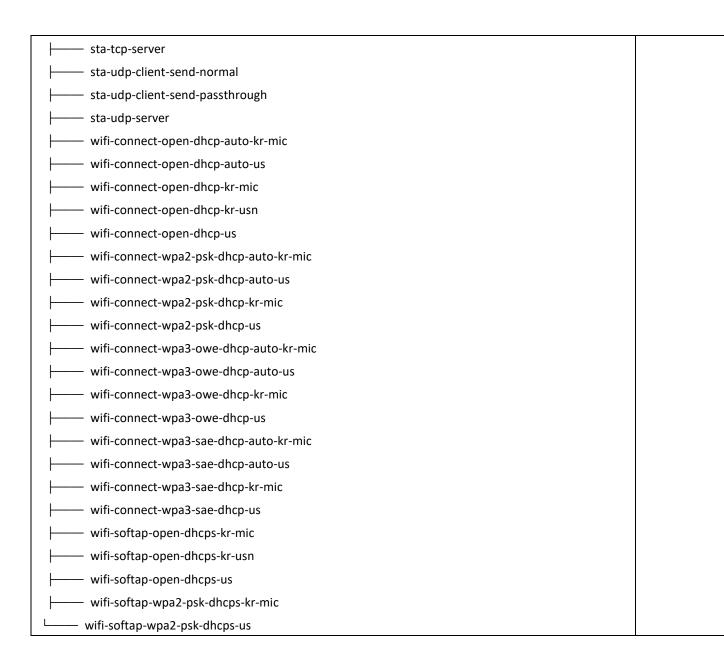

The script file can be created using the AT command and script command.

Command	Description	Example
CALL <script_file></script_file>	Read and run the specified script file.	CALL wifi_connect CALL wifi/connect
LOOP <line> <count></count></line>	Repeat next lines. line>: number of lines to repeat <count>: number of repetitions.</count>	LOOP 2 5 AT+SSEND=0,1024 DATA 1024
DATA <length></length>	Send payload with random value.	DATA 1024

WAIT <time>{s m u}</time>	Wait for the specified time. s: sec m: msec u: usec	WAIT 1s WAIT 1000m WAIT 100u
ECHO " <message>"</message>	Print a message.	ECHO "AT Command"
TIME	Print current time.	TIME
HOLD	Pause until there is keyboard input.	ECHO "Run an AP in open mode" HOLD
EXIT	Exit script.	EXIT

Users can refer to the script files under the "raspi-atcmd-cli/scripts" directory.

8.1.5 **Iperf**

The CLI application supports the iperf2 command used for network performance measurement. However, the available options are limited as shown below.

```
# iperf {-h|--help}
```

```
Usage: iperf {-s}| {-c < host>} [options]

Client/Server:
-i, --interval # seconds between periodic bandwidth reports (default: 1 sec)
```

```
-p, --port #
                        server port to listen on/connect to (default: 5001)
                         use UDP rather than TCP
  -u, --udp
Server specific:
  -s, --server
                        run in server mode
Client specific:
  -c, --client <host> run in client mode, connecting to <host>
  -t, --time #
                      time in seconds to transmit for (default: 10 sec)
  -P, --passthrough
                        transmit in passthrough mode
                        use negative length for buffered passthrough mode (always negative in UDP)
  -N, --negative
 -D, --done vent
                         enable SEND DONE event
Miscellaneous:
  -h, --help
                         print this message and quit
```

The iperf command can be run after completing the Wi-Fi connection and IP setup.

Wi-Fi connection and IP setup can be done in one of two ways:

• Enter AT command in the CLI application.

```
#AT+WSCAN
SEND: AT+WSCAN
RECV: +WSCAN:"8c:0f:fa:00:28:1f",914.0,-38,"[WPA3-SAE-CCMP][ESS]","halow_atcmd_sae"
RECV: OK

#AT+WCONN="halow_atcmd_sae","sae","12345678"
SEND: AT+WCONN="halow_atcmd_sae","sae","12345678"
RECV: OK

#AT+WDHCP
SEND: AT+WDHCP
RECV: +WDHCP:"192.168.200.18","255.255.255.0","192.168.200.1"
RECV: OK
```

 Specify a script file containing AT command with the -s option when running the CLI application.

\$ sudo ./raspi-atcmd-cli -S -s scripts/example/wifi-connect-wpa3-sae-dhcp

```
CALL: scripts/examples/wifi-connect-wpa3-sae-dhcp

SEND: AT

RECV: OK
```

```
SEND: AT+WDISCONN
RECV: OK

NOTE:

When sending data in passthrough mode with the -P option, the socket can only be closed after receiving the SEND_IDLE event. It takes more than 1 second after sending the last data. So, the remote iperf tcp server stops after 1 second.

8.2 Remote Server/Client (raspi-atcmd-remote)

A remote server/client application run one server or client. This application is a Linux application and can be executed on Raspberry Pi.

8.2.1 Source files

File	Description	
main.c	UDP/TCP server/client related functions	
Makefile	Makefile Make file for building	

Table 8.2 raspi-atcmd-remote source files

8.2.2 Build

Copy the "atcmd/host/raspi-atcmd-remote" directory to the Raspberry Pi's home directory. And build the remote application with the make command.

\$ cd \$HOME

\$ cd raspi-atcmd-remote

\$ make clean

removed 'raspi-atcmd-remote'

\$ make

cc -g -o raspi-atcmd-remote main.c -Wall -Wno-unused-function -DCONFIG_VERBOSE

8.2.3 Run

\$./raspi-atcmd-remote [-h|--help]

raspi-atcmd-remote version 1.2.0 Copyright (c) 2019-2023 < NEWRACOM LTD> Usage: \$./raspi-atcmd-remote -s [-p <listen_port>] [-u] [-e] \$./raspi-atcmd-remote -c <server_ip> [-p <server_port>] [-u] [-e] Options: run in server mode -s, --server -c, --client # run in client mode -p, --port # set server port to listen on or connect to (default: 50000) -u, --udp -e, --echo enable echo for received packets (default: off) -v, --version print version information and quit print this message and quit -h, --help

Examples:

Mode	Protocol	Command		
Server	ТСР	\$./raspi-atcmd-remote -s -p 50000 [-e]		
	UDP	\$./raspi-atcmd-remote -s -u -p 60000 [-e]		
Client	ТСР	\$./raspi-atcmd-remote -c 192.168.200.1 -p 50000 [-e]		
	UDP	\$./raspi-atcmd-remote -c 192.168.200.1 -u -p 60000 [-e]		

9 Revision History

Revision No	Date	Comments	AT Command Set
1.0	08/04/2023	Initial version	v1.23.5
1.1	08/16/2023	Added commands: AT+WCTX	v1.23.6
